

Degree Programme in Medicine and Surgery
Academic Year 2026 /2027

INTEGRATED COURSE (I.C.): Microbiology

NUMBER OF CFU (ECTS credits): 8

SSD (Academic Discipline Code): MEDS-03/A, MVET/03B

COORDINATOR OF THE I.C.: Prof. Daniele Armenia

E-MAIL: Daniele.armenia@unicamillus.org

MODULE 1: BACTERIOLOGY

NUMBER OF CFU (ECTS credits): 4

SSD (Academic Discipline Code): MEDS-03/A

LECTURER: Claudia Trappetti (3 CFU)

e-mail: Claudia.trappetti@unicamillus.org

LECTURER: Bouba Yagai (1CFU)

e-mail: Yagai.bouba@unicamillus.org

MODULE 2: VIROLOGY

NUMBER OF CFU (ECTS credits): 3

SSD (Academic Discipline Code): MEDS-03/A

LECTURER: Daniele Armenia (2 CFU)

e-mail: Daniele.armenia@unicamillus.org

LECTURER: Ilaria Vicenti (1 CFU)

e-mail: Ilaria.Vicenti@unicamillus.org

MODULE 3: PARASSITOLOGY

NUMBER OF CFU (ECTS credits): 1

SSD (Academic Discipline Code): MVET/03B

LECTURER: Pichler Verena

e-mail: verena.pichler@unicamillus.org

PREREQUISITE COURSES

None required

PREREQUISITES

Although there are no preparatory prerequisites, it is necessary for the student to know the basic concepts of physics, biochemistry, cellular biology, genetics, histology and anatomy.

LEARNING OBJECTIVES

Essential learning objectives include knowledge of the cellular and molecular basis of microbial pathogenicity, of the interactions between microorganism and host, of the causes and mechanisms underlying the onset of the main diseases of bacterial, viral, fungal and parasitic aetiology, and of the applications of biotechnology in diagnosis, prophylaxis and antimicrobial chemotherapy. These objectives will be achieved through lectures, seminars and interactive teaching activities, designed to facilitate learning and to improve the ability to address and solve the main questions of Medical Microbiology.

EXPECTED LEARNING OUTCOMES

DD 1: Knowledge and understanding

Upon completion of the Course of Microbiology, Students should be able to:

- Demonstrate the ubiquity and diversity of microorganisms in the human body and the environment.
- Illustrate the distinctive features of the different types of microorganisms and their ecological niche.
- Explore mechanisms by which microorganisms cause disease (microbial pathogenicity and virulence).
- Show how the human immune system counteracts infection by means of specific and nonspecific mechanisms.
- Know the main human pathogens (bacteria, viruses, fungi and parasites) and the diseases they cause.
- Recognize the way of transmission of infectious agents in hospitals, communities and populations and the methods used to control it.
- Demonstrate the principles of vaccine preparation and the use of vaccines in immunization practice.
- Define the role of disinfection and sterilization in the context of the patient care and the environment.
- Illustrate the basic principles and functioning of the common antimicrobials (antibiotics, antivirals, antifungal and antiparasitic agents) .
- Be aware of the contribution of the microbiology laboratory to the diagnosis and management of infectious diseases. In particular, to know the diagnostic path including collection, transport, handling and processing of clinical specimen (direct microscopic exam, staining techniques, seeding and isolation, biochemical identification, antimicrobials-sensitivity tests, cell cultures, PCR, genotyping, next-generation sequencing, serology).

DD 2: Applying knowledge and understanding

- Apply the general microbiological knowledge to the clinical setting, being able to

- understand the basic principles of infectious diseases.
- Approach to the main diagnostic tests to assess infectivity and/or disease in hospitals, communities and populations.
- Provide a differential diagnosis of microbial diseases based on the identification of specific signs and symptoms and the interpretation of laboratory data, providing a comprehensive explanation of the underlying reasoning.
- Describe the practical aspects of the diagnostic instruments in microbiology: when to use them and how to perform them in research laboratories and clinical settings.

DD3: Making judgements

- Recognize the importance of an in-depth knowledge of general and medical microbiology consistent with a proper medical education.
- Identify the fundamental role of a proper theoretical knowledge of microbes and antimicrobials in the clinical practice
- Recognize the relevance of the microbiological research in social politics of promotion of public health and environmental defence.
- Be able to critically argue the findings obtained in the microbiological field in relation to data available in the actual international literature.

DD4: Communication skills

- Present the topics orally in an organized and consistent manner.
- Use of proper scientific language coherent with the topic of discussion. - Be capable to have a discussion in class with other students on the microbiological topics addressed in previous lessons and/or topics of public interest on microbiological issues, possibly utilizing different supports such as ppt presentation and consultation of scientific and institutional databases (Pub Med, Scopus, Italian Ministry of Health, ECDC, WHO etc.)

DD5: Learning skills

At the end of the integrated teaching, the student will acquire skills useful to deepen and expand their knowledge in the field of laboratory medicine, also through the consultation of scientific literature, databases, specialized websites.

SYLLABUS

Syllabus MODULE 1:

General Bacteriology: Criteria for bacterial taxonomy and classification. The architecture of the bacterial cell : the bacterial chromosome, the cytoplasm, the cytoplasmic membrane. Gram staining. Gram positive and gram negative bacteria. Capsule. Flagella. Pili and fimbriae. Metabolism and bacterial growth: the production of bacterial spores. Bacterial genetics:

chromosome and plasmids. The transfer of genetic material : transformation, transduction and bacterial conjugation. The pathogenic activity of bacteria and the stages of the infectious process. The bacterial adhesiveness, the ability to invade hosts, the production of toxins. Structure and mechanisms of action of exotoxins and endotoxins. The role of innate and cell-mediated immunity in bacterial infections. Immune sera and vaccines. General principles for the diagnosis of bacterial diseases. Antibacterial drugs and their mechanism of action. Mechanisms of bacterial resistance to antibacterial drugs.

- **Special Bacteriology:** Staphylococci. Streptococci. Pneumococci and Enterococci. Bacilli and Clostridia. Corynebacteria and Listeria. Enterobacteriaceae. Pseudomonas. Vibrio, Campylobacter and Helicobacter. Emophili, Bordetella and Brucella. Yersinia and Pasteurella. Neisseria. Anaerobic microorganisms. Legionella. Mycobacteria. Spirochetes. Mycoplasma. Rickettsiae. Chlamydiae. Gardnerella.
- **Mycology:** Fungi : structure, replication and dimorphism. Mechanisms of fungal pathogenicity. Fungal infections by opportunistic fungi. Superficial, cutaneous, subcutaneous and systemic mycoses. Mechanisms of action of antifungal agents.

Syllabus MODULE 2:

- **General Virology:** Nature, origin and morphology of viruses, viral nucleic acids, proteins and lipids viral multiplication of animal viruses, virus-cell interaction. State of persistence and latency of the genome in the cell, host cell cultures, multiplication cycle, virus isolation animals, adaptation and virulence, inactivation of viruses, physical and chemical agents, cell surface antigens encoded by the virus, the immune response to viral infection. Viral genetic and pathogenesis of viral infection. Basis of viral oncogenesis and viral spill-over events. Interferons. Vaccines and antiviral chemotherapy.
- **Special Virology:** Adenovirus, Herpesvirus, Poxvirus, Papovavirus, Hepadnavirus, Parvovirus, Picornavirus, Orthomyxovirus, Paramyxovirus, Rhabdovirus, Coronavirus, Flavivirus, Togavirus, Hantavirus, arthropod-borne and zoonotic viruses. Filovirus, Reovirus and Rotavirus. Hepatic viruses (A, B; C, D; E). Human Retroviruses. RNA and DNA tumour viruses. Prions.

Syllabus MODULE 3:

- **General Parasitology:** Systematics and Zoological Nomenclature. Biological associations. General information on the life cycles of parasites, parasitic specificity, host-parasite interactions and pathogenic action of parasites. Parasitic diseases of medical importance. Fight against parasitic diseases. General characteristics of metazoan parasites (trematodes, cestodes, nematodes) and correlated diseases.
- **Special Parasitology:** Life-cycle, pathogenesis, and prevention of main parasitic protozoans of the following groups: Amoebae. Flagellates. Ciliates. Sporozoans. Vectors of parasitic diseases.

COURSE STRUCTURE

The course is structured in frontal teaching, divided into lessons of 2/3 hours according to the academic calendar and 2.5 hours of practical activities are provided for each ECTS credit.

The frontal teaching includes:

- introductory lessons that will describe in detail the topics listed in the programs (all object of study for the exam); the topics covered during frontal lessons; the modality of the final exam
- frontal lessons that will cover the topics of main importance that require a didactic guide to facilitate comprehension ;
- integrative seminars that will concern microbiology topics of current clinical interest that will allow to provide study ideas in a modern and avant garde perspective.

COURSE GRADE DETERMINATION

The exam requires the study of all the topics listed in the above mentioned syllabus and it will be structured in two parts:

- A written test with multiple choice questions, with only one correct answer, concerning all the topics listed in the bacteriology, mycology, virology and parasitology study programs. This test is a selective test which aims to evaluate only learning skills and needs a further oral exam. To access the oral exam of microbiology the student must have achieved a score ≥ 18 in the written test.
 - An oral test for each module in which the making judgments and communication skills will be evaluated. Following these evaluations, the test may confirm, improve or worsen the results of the written test.

The Examining Board will evaluate the student's ability to apply the knowledge and will ensure that the skills are adequate to support and solve problems related to microbiology. As described above, by joining the results of written and oral exams, the making judgements, communication and learning skills will be evaluated according to the Dublin descriptors. The exam will be evaluated according to the criteria indicated in the table below and will constitute an integrated assessment of the 3 modules making up the course.

Fail	Significant gaps and/or inaccuracies in knowledge and understanding of the topics; limited analytical and synthesis skills; argumentation absent or frequently incorrect.
18–20	Barely sufficient knowledge and understanding of the topics, with possible imperfections; sufficient analytical, synthesis, and judgement skills.
21–23	Routine knowledge of the topics; correct analytical and synthesis skills with coherent logical argumentation.
24–26	Fair knowledge and understanding of the topics; good analytical and synthesis skills; rigorously expressed argumentation.

27–29	Complete knowledge of the topics; considerable analytical and synthesis skills; good independent judgement.
30–30L	Excellent level of knowledge and understanding. Considerable analytical, synthesis, and independent judgement skills. Original argumentation expressed with full command of specialized terminology.

OPTIONAL ACTIVITIES

By prior appointment arranged via email, all teachers of the integrated course are available for office hours, either online or in person depending on needs.

READING MATERIALS

The slides used in class will be made available to students at the instructor's discretion, only after the end of each individual lecture.

Texts MODULE 1

- Patrick R. Murray et al. Medical Microbiology, Elsevier / Masson Editors _10th Edition.

Texts MODULE 2

- Patrick R. Murray et al. Medical Microbiology, Elsevier / Masson Editors _10th Edition.

Texts MODULE 3

- For the parasitology module, it is strongly recommended to consult the material provided during lectures, which can be supplemented with the following text: Patrick R. Murray et al., Medical Microbiology, Elsevier / Masson, 10th Edition. Patrick R.
